CCAIS Website — Content Guide

Static Astro site (live at **ccais.ac.uk**). Content = Markdown files + one team file (`src/data/team.ts`). **Push to `main` → GitHub Actions builds and deploys** (live in a few minutes); nothing is built or uploaded by hand.

Access

- Repo: **https://github.com/Citizen-Centric-AI-Systems-CCAIS/citizen-centric-ai-systems-ccais.github.io**
- Direct push needs **collaborator (write) access** — ask an admin (Seb Stein) to add your GitHub username.
- No write access → **fork + pull request** (also the route if you want review first; see Pull requests).

Setup

```
git clone git@github.com:Citizen-Centric-AI-Systems-CCAIS/citizen-centric-ai-systems-cca
npm install
npm run dev              # http://localhost:4321  (site search only works in a full buil
npm run optimize-images  # optional: archive + down-scale oversized images in public/
```

Where content lives

Type	Folder	URL
Blog	`src/content/blog/`	`/uncategorised/<file>/`
News	`src/content/news/`	`/latest-news/<file>/`
Project	`src/content/projects/`	`/projects/<file>/`
Event	`src/content/events/`	`/events/<file>/`
Impact	`src/content/impacts/`	`/impacts/<file>/`
Open source	`src/content/open-source/`	`/open-sources/<file>/`

- Filename → URL slug (`kebab-case`).
- Images live in `public/images/{news,projects,team}/` (create others as needed), referenced as `/images/….`

Frontmatter

Field	Required	Notes
`title`	yes	quoted
`date`	yes	`YYYY-MM-DD`; sorts newest-first
`image`	no	`/images/…`; omit → coloured gradient header
`imageCredit` / `imageCreditUrl`	no	small footer credit (+ optional link)
`excerpt`	no	overrides the auto-summary (first paragraph)
`author`	no	team **slug** → adds a byline, lists on their page
`members`	no	list of slugs and/or `{ name, url }` (external, no page)

Field	Required	Notes
`eventDate`	events only	`YYYY-MM-DD` (the day the event starts)
`eventEndDate`	events, no	`YYYY-MM-DD` — end day for a multi-day event
`location`	events, no	venue name, e.g. `"Highfield Campus, University of`
`locationUrl`	events, no	joining link for an **online** event (used instead of `loca`
`eventStatus`	events, no	`scheduled` (default), `cancelled`, `postponed`, `reschedul`
`performers`	events, no	list of speakers — each a plain name, or `{ name, affi`

First paragraph = listing summary + meta description. No image is fine.

The extra event fields above feed Google's Event rich-result data (they surface as *recommended* items in Search Console). Only `eventDate` is required; the rest are optional and safe to omit.

Add a post (blog / news / project)

New `.md` in the matching folder (see table). Same schema for all three:

```
---
title: "…"
date: 2026-07-03
author: your-slug
image: "/images/news/foo.jpg"
imageCredit: "Photo by Jane Doe on Unsplash"
imageCreditUrl: "https://unsplash.com/@janedoe"
members:
  - sebastian-stein
  - { name: "Dr Bahar Rastegari", url: "https://www.southampton.ac.uk/people/5xrg8y/doct
---

Body in Markdown. Lead with a strong first paragraph.
```

`author`/`members` are team slugs; inline `{ name, url }` credits an external person with no CCAIS page. Members appear in a "Team:" line under the title (team slugs link to the person's page, external entries to `url` if given), and the post is listed on each team member's page. Then commit/push (or PR).

Team (`src/data/team.ts`)

Single source of truth; the `/author/<slug>/` pages and the team page are generated from it.

- **Edit someone:** find their block, change fields. Retiring them → set `group: "Alumni"`.
- **Add someone:** drop a square photo in `public/images/team/`, then add a block in the right group's section (order within a group = display order):

```
{
  slug: "firstname-lastname",     // unique; → /author/firstname-lastname/, used in auth
  name: "Dr Firstname Lastname",
```

```
  role: "PhD Student — Topic",
  group: "PhD Students",          // Researchers | PhD Students | Research Engineers / A
  photo: img("firstname-lastname.jpg"),
  email: "x@soton.ac.uk",         // optional
  websites: ["https://…"],        // optional; string or { label, url }
  biography: `…`,                 // optional
},
```

External collaborators without a page: inline `{ name, url }` in a post's `members`, or add them once to the `collaborators` list at the bottom of `team.ts` and reference by slug.

Pull requests

- **Have write access, want review:** branch → push → PR → merge.
- **Read-only:** fork → PR (the GitHub web editor auto-forks and opens a PR via *Propose changes*).
- Only `main` deploys — a PR never touches the live site until merged.

Gotchas

- Red build in **Actions** = almost always a frontmatter typo (missing `---`, unquoted `title`, bad `date`, or a missing comma/quote in `team.ts`).
- Renaming a file/slug changes its URL and breaks inbound links.
- Don't delete `public/google….html` (Search Console verification).
- Sitemap, search index, OG/Twitter tags, JSON-LD, `llms.txt` and `team.json` are all auto-generated — just add content. `team.json` is read by other sites (e.g. Seb's personal website), so team edits appear there too after their next build.
